

# Hospital Management System

## Abstract:

“Hospital management system” is useful to maintain the information regarding hospital working so that we can avoid maintaining paper based records which makes an efficient and safe information management and the organizer can also monitor the working of hospital. Hence I have proposed Hospital management system. In this project I have used Django web framework for effective user interface. where the **organizer** of the hospital have to signup/login into site then he can perform CRUD operations on doctors, patients, appointments. like adding, updating and deleting doctors, patients, appointments.
